

# Design Process & Interaction Fundamentals

Informatics 132  
4/15/2012

# Hick's Law

Go to page 1

The time it takes to make a decision increases as the number of alternatives increases.<sup>1</sup>

## TODAY

- Some comments on sketching...
- The Design Process & Interaction Fundamentals

## UPCOMING

- Due Friday:
  - S2: Health & Fitness*
  - A1: Thinking About Design*

# Why sketch?

- The sketches for S1 were nice. Let's make them great.
- Use the sketches to think beyond your solution.
- Use the sketches to think beyond your problem.
- Example: USB stick.

May stop anywhere on this line, which is fine!

Go through this

object  
Physical interactions  
Mouse, keyboard, screen  
~~left click~~

Physical Software interactions  
What things are on screen.  
Where things are.  
States.

LEARNING THE BASICS

Navigation  
Right/left click  
Backwards, forward,  
opening, closing,  
saving, undoing.

REGIONS  
Titlebar, toolbar,  
Taskbar

WAYS TO TEACH THEM STUFF.

LEARN AS YOU GO  
LEARN BY EXAMPLE

HOW DO USERS GET CONFIDENT

How do you ask someone "Is this your first time using a pc?" without getting annoying?

What about OEMS overriding everything...?

If you need to know one thing

(Shades of the office culture)

Is there any way of establishing a user experience?  
Ask them → Annoying  
Try and guess → unpredictable

Do you need help with a concept?  
Do you need help from a friend? → Network of friends.  
New user support group

Not knowing the basics  
↓  
Not knowing how to set something up. → Not online ∴ problem.  
↓  
Ignoring warnings

Problem 1: figuring out the expertise of someone.  
Problem 2: knowing what they need help with.  
Problem 3: Building a UI that goes as they go.

Toolbar banner on screen as first

Facial sharing screen.

Big meeting: me:

TRENDS: making best guesses  
TRENDS BUG: / 600+ articles / con reports  
BC themes / alias / watching for bleeding edge.

DESIGN: Primarily focused on rapid prototyping generation. Slow pace towards final presentation

THEMES: Structuring the work. How these were created / what they try groups do

Work: rapid sketches to try out ideas / conclusions / package of work / visualizations  
STORAGE

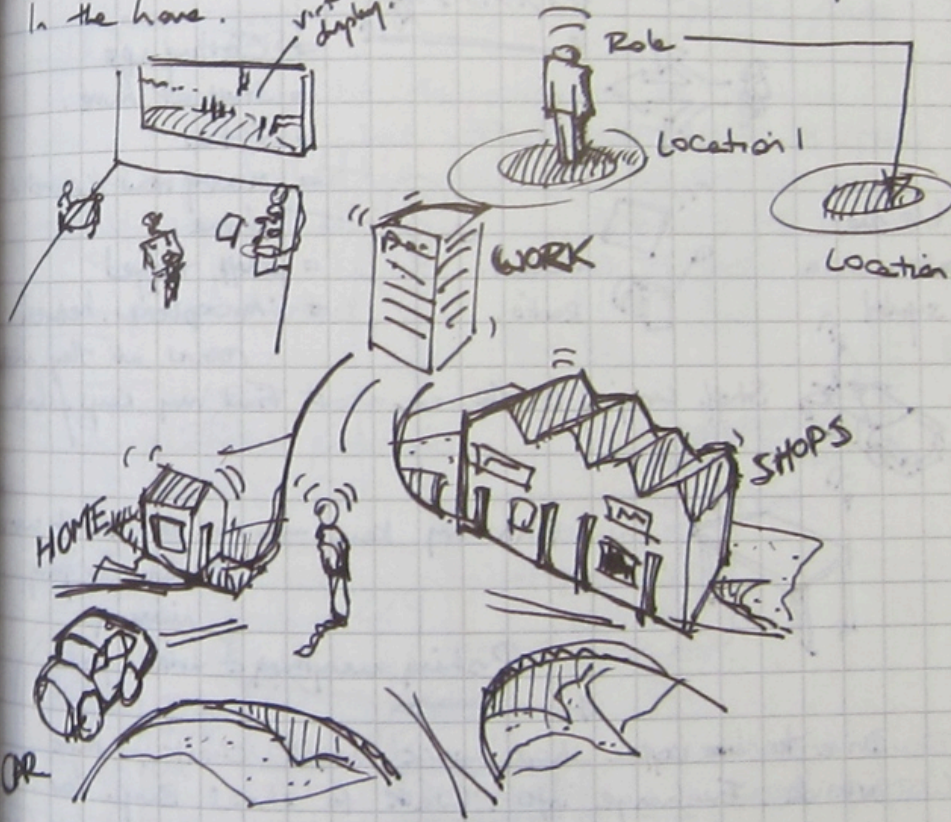

Hand over to Don: essential UI + up.

SMART:  
RJ04 KDN

Location - Location - Location.

In the park.  
In the car.  
In the home.

Freedom - Liberation - Control.  
Fun - Connection - Play.

features

# snapshot

Gives you your colleague's very latest updates up front and out loud.

# snapshot

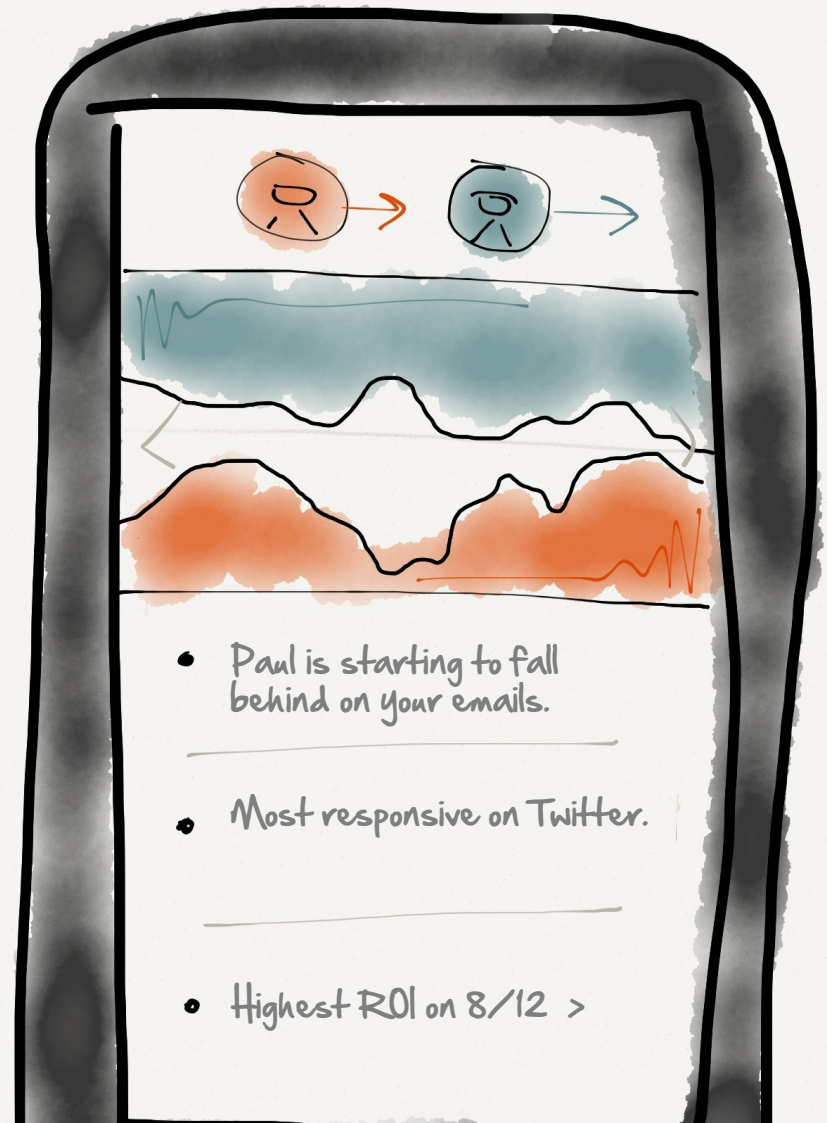

"I can see this being used to keep up with friends from a distance... for someone in-between a person I'd Google, and people I'd invest time to catch up with."

"It's therapeutic and flattering to know someone is using this to read my own updates."

# trend

Visualizes the amount, type, & quality of your interactions in order to optimize your interpersonal communication channels.

# trend

"It's about scoping a holistic picture of our interactions and interest in each other over time."

"It helps to represent all interactions I've had, and the forms they take."

"It's helpful - there's a pleasure in reviewing when we're far apart, but also when we've been in touch. Then I'm reminded to stay in touch."

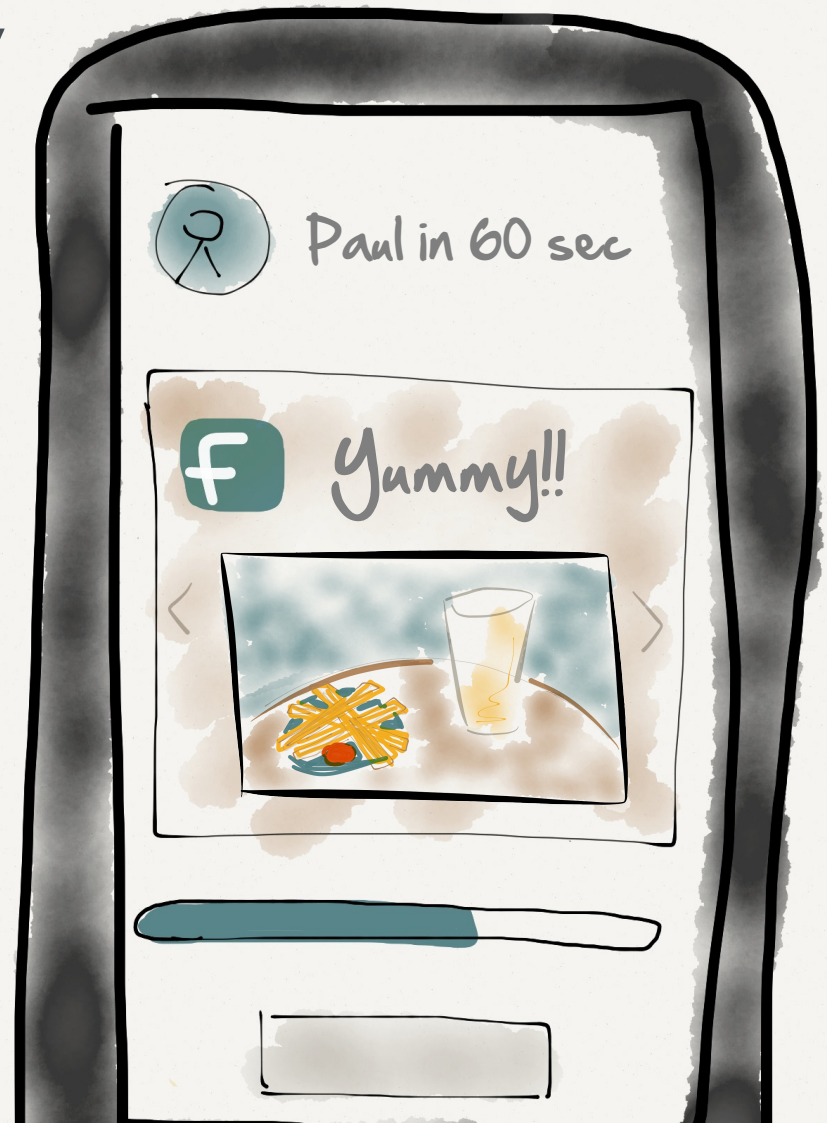

# currentcy

Short on time? In 60 seconds, Currentcy gives you a rapid overview of the latest details.

# currentcy

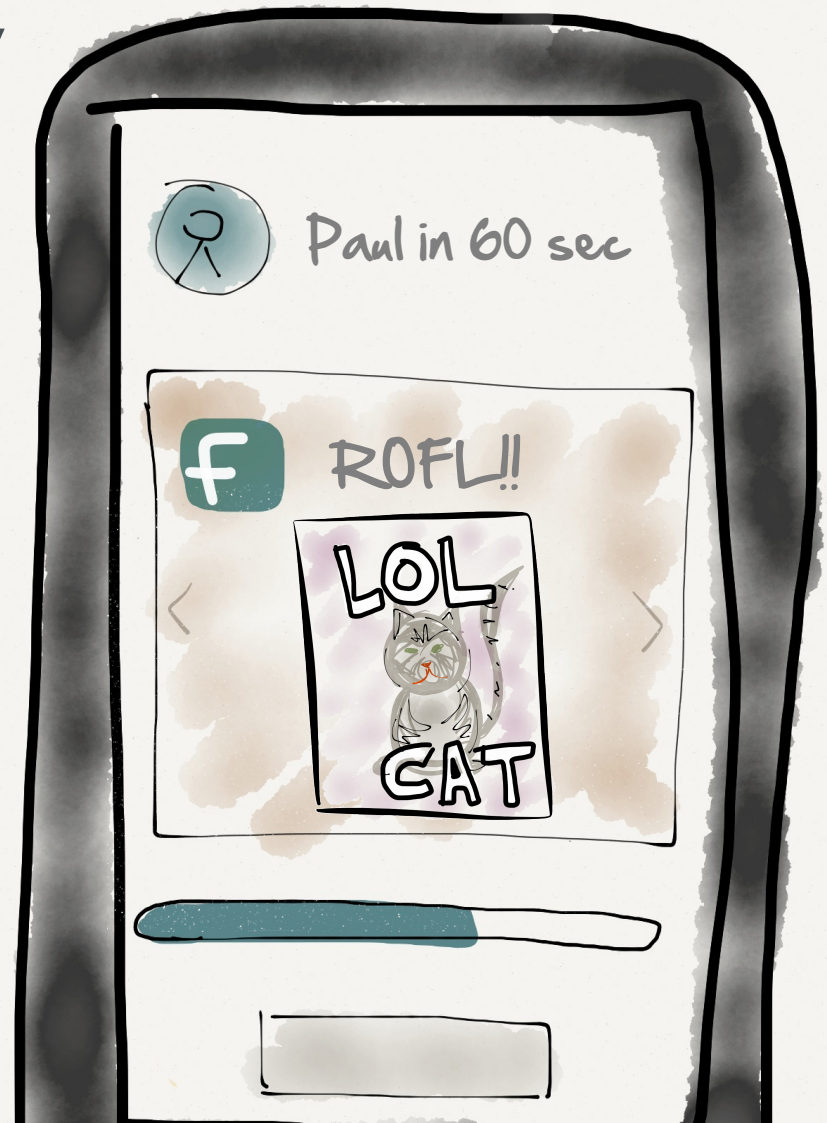

Short on time? In 60 seconds, Currentcy gives you a rapid overview of the latest details.

# currentcy

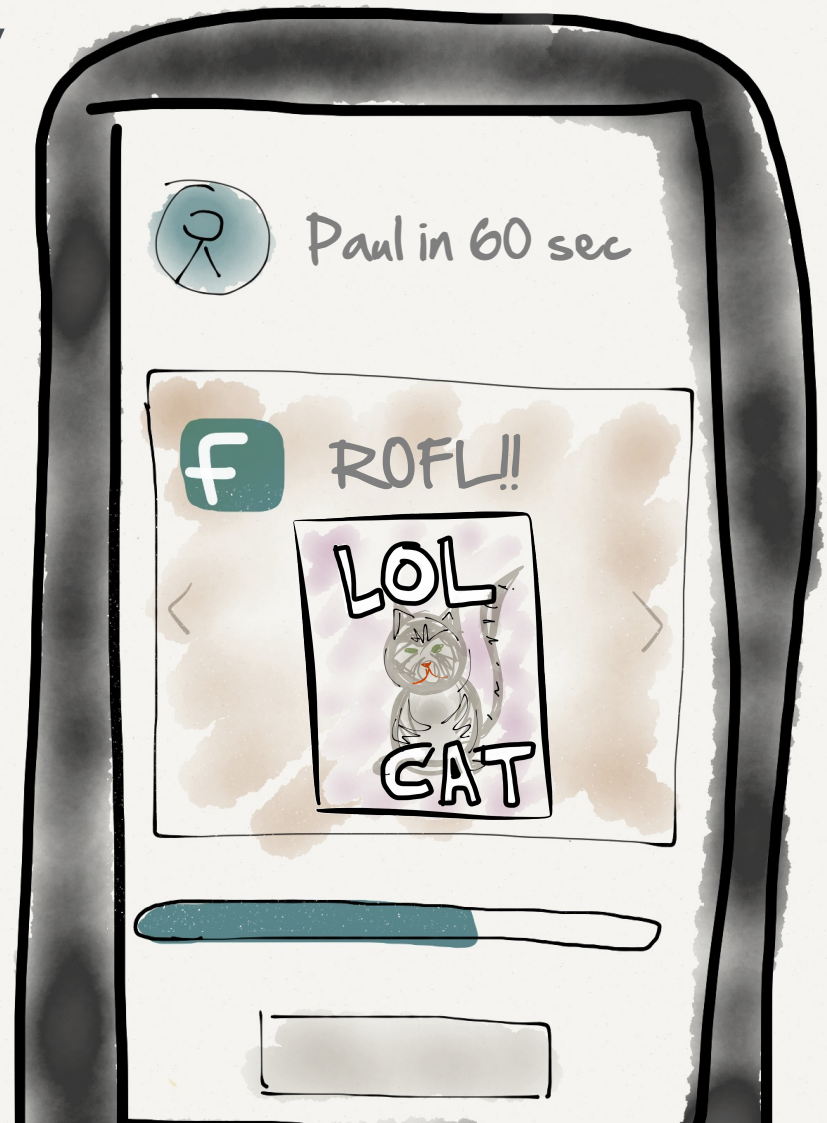

Short on time? In 60 seconds, Currentcy gives you a rapid overview of the latest details.

# currentcy

"It feels very immediate. To be reminded about events in my friends' lives is very useful."

"It's a guilt reliever. It's embarrassing if it comes out that I didn't really look at her posts."

# dashboard

“I don’t mind if someone else uses it, but I wouldn’t touch it.”

“I would feel like I was under a surveillance regime.”

# Why a design process?

- It helps us get started with a proven tack
- It prevents “designer's block”
- It keeps us directed toward a final product
- It helps us stay on schedule and within cost
- It helps us measure design progress
- It helps us communicate where we are to others
- It prevents us from omitting important steps
- It is more reliable than intuition
- It forces us to iterate!
- It helps us keep the user first!

Designers' expertise...

...lies not in the thing he or she is designing.

You do not have to be a *widget expert* to be a *designer of a widget-manufacturing interface*.

Instead, you must be an expert in the process of design.

# What is designed?

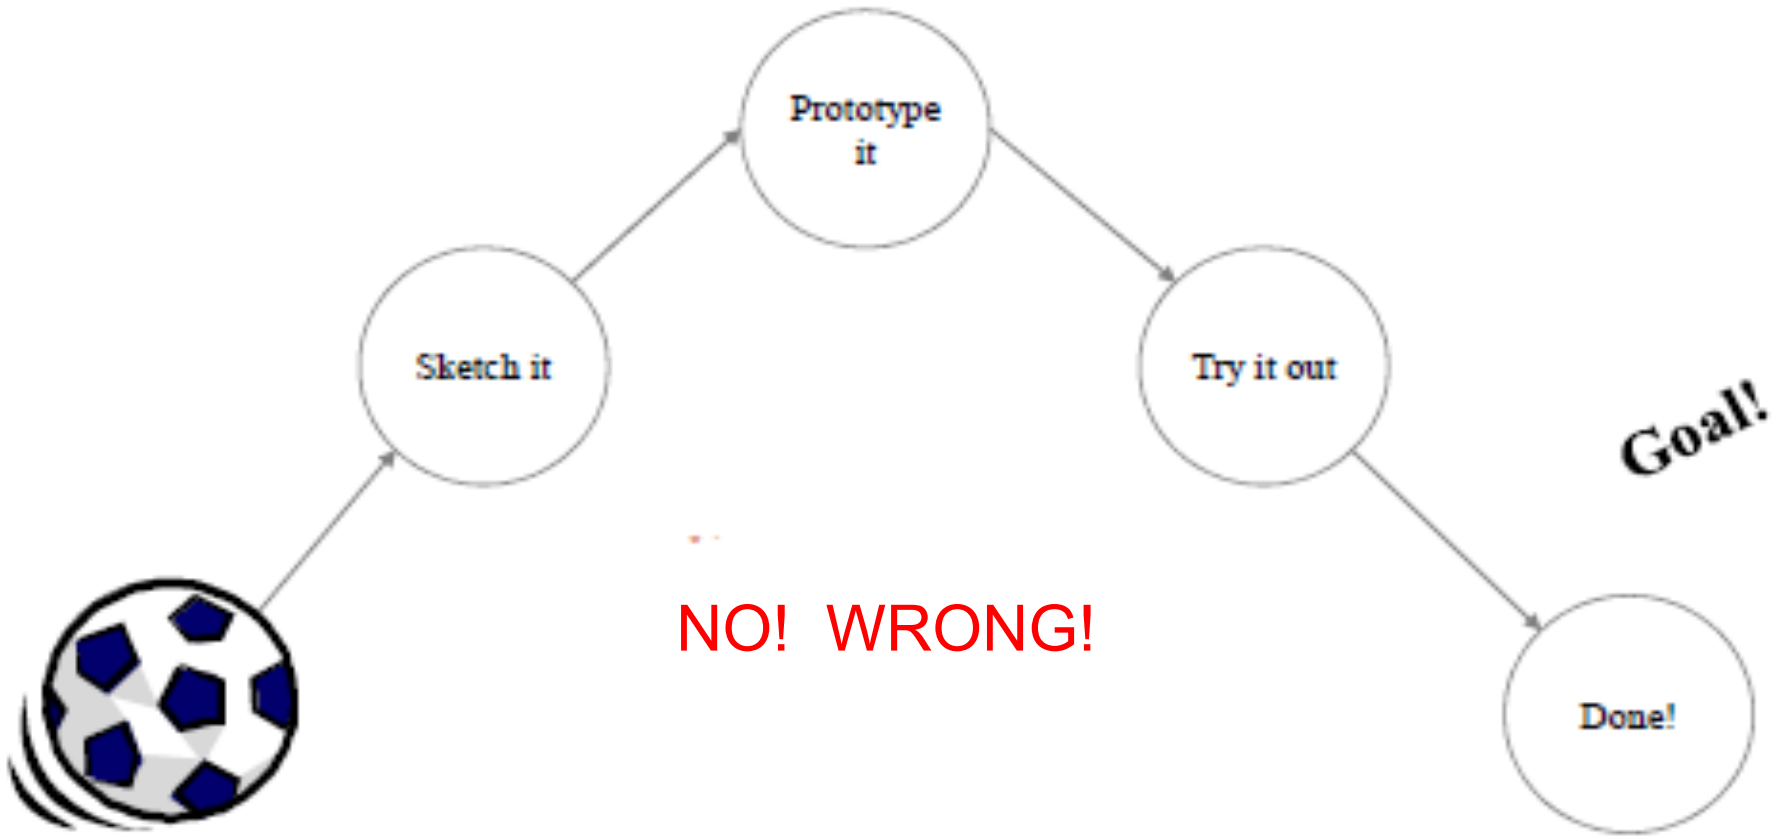

**Artifact view:** The object, device, or system that is designed

**Holistic view:** The interaction, the flow, the user's experience is designed

Think in terms of users' goals:

- Artifacts have no goals
- People have goals!
- Keep users in the center in the beginning, middle, and end

# Design Process?

# Design Requires Iteration

# Stage Goals

- Learn about stakeholders
- Discover goals and needs
- How is it done now?
- What is wanted?
- What else has been tried?

Investigate

Produce

- Build final product
- Ramp up marketing, support, and maintenance

Evaluate

- Discover problems
- Assess progress
- Determine next steps

- Generate lots of ideas
- Grasp issues and potential solutions

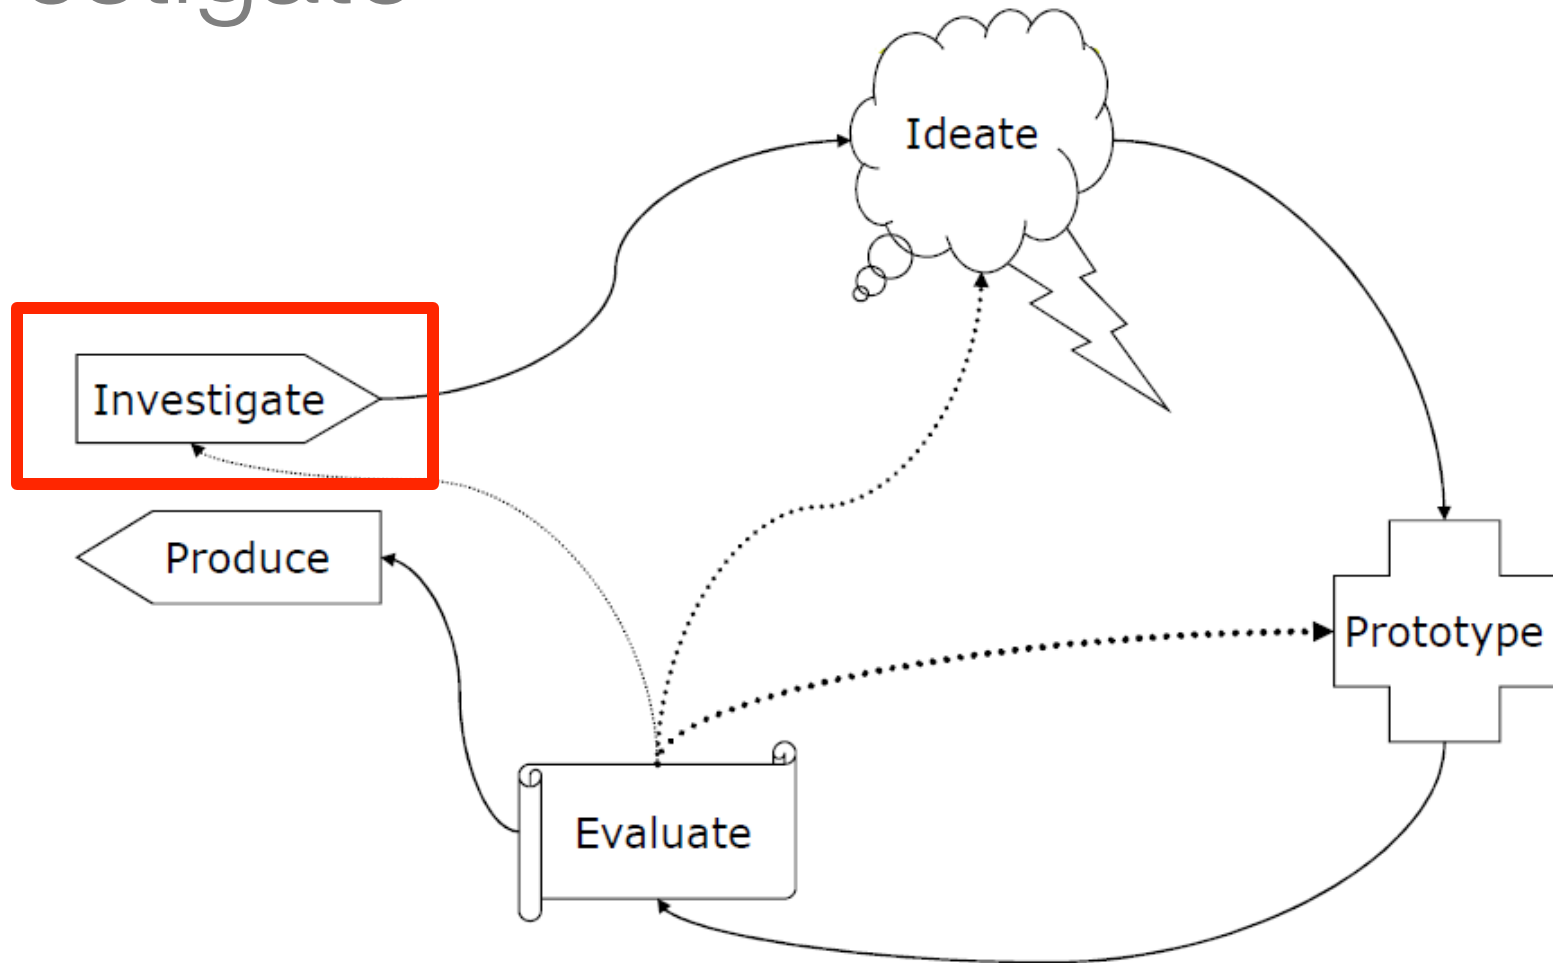

Ideate

Prototype

- Produce something tangible
- Identify challenges
- Uncover subtleties

# Investigate

# Why investigate?

You cannot design apart from the world in which your users and design will live

# Investigation Questions

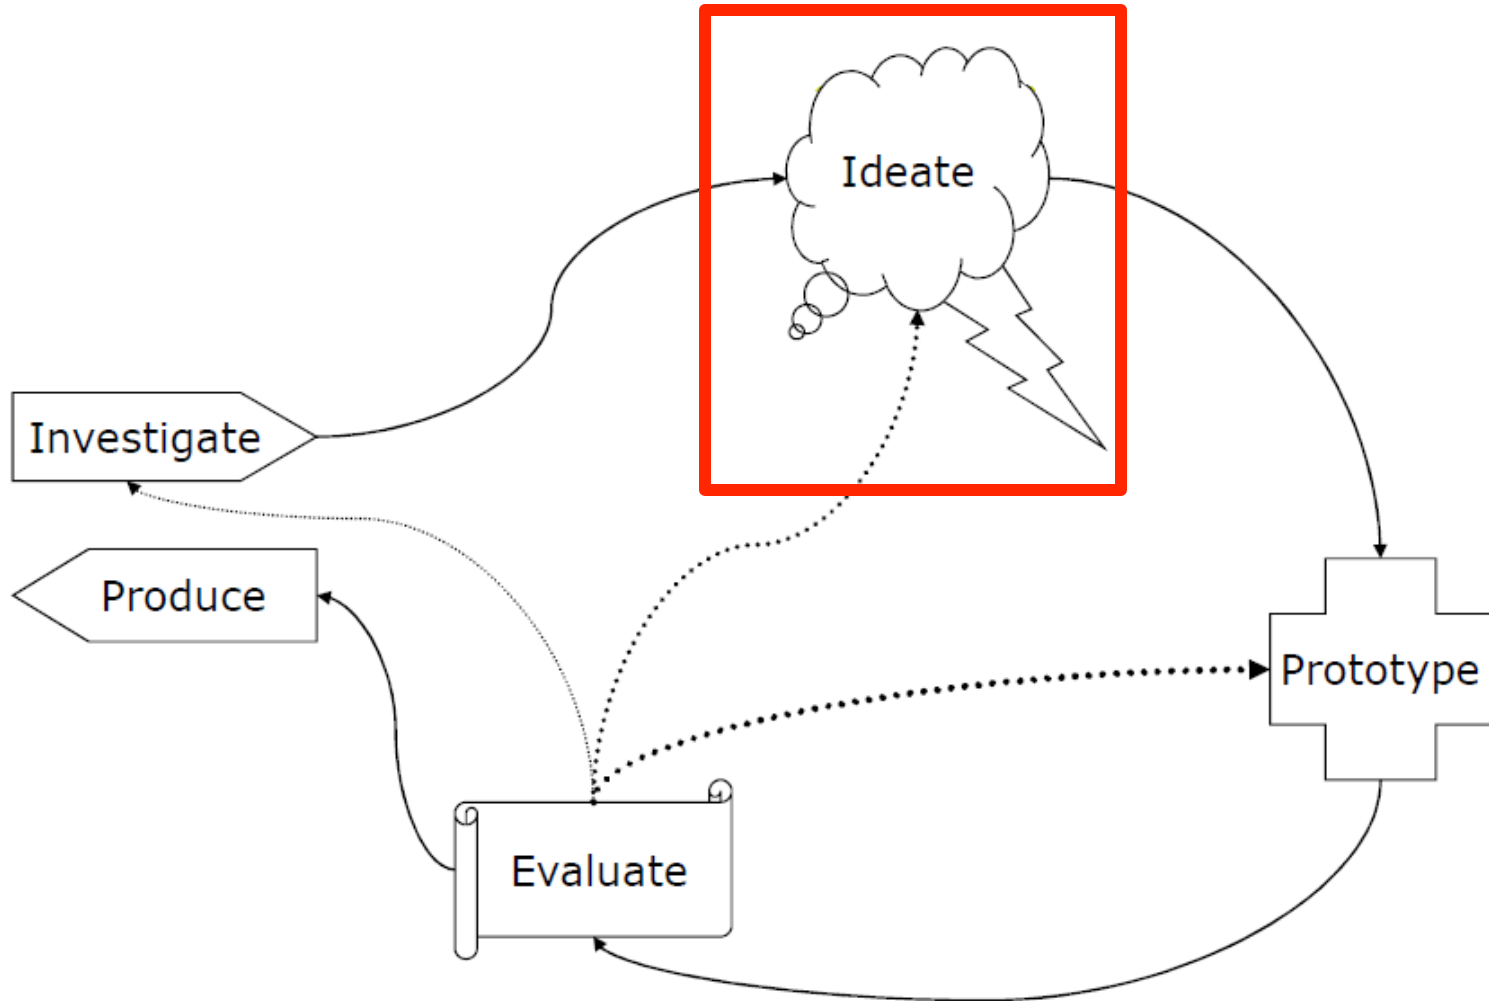

- Identify users
- Identify stakeholders
- What are the requirements?
- How do they do it now?
- How long does it take?
- What do they want?
- What do they need?
- What else have they tried?
- Is there already another solution?

# Investigation Methods

- User surveys
- Focus groups
- Interviews
- Analysis of competition
- Contextual inquiry
- Design Ethnography

This is what next week is all about!

# Ideate

# Ideation

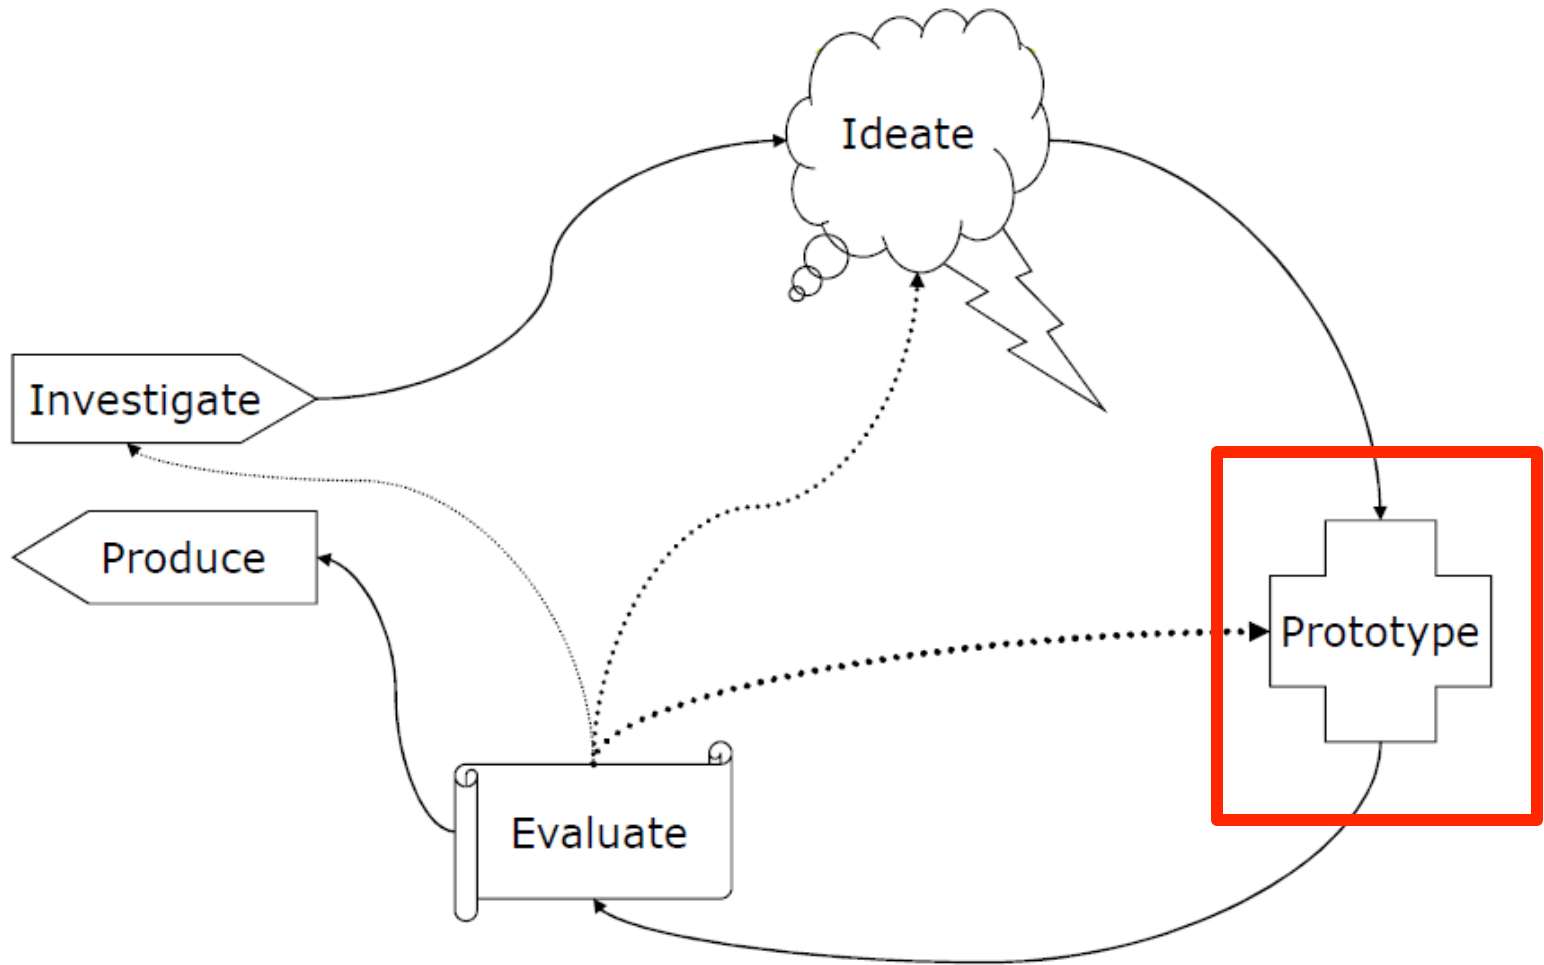

- Ideation = “idea generation”
  - *Volume matters most!*
- To increase the chances for success by considering a huge volume of ideas in a systematic way
- One of the worst things you can do is go with the first idea that you get
  - You can always come back to it later

# Ideation Methods

- Affinity diagramming
- Personas
- Scenarios
- Role-playing, play-acting, scripts, props
- Card sorting
- Structured Brainstorming
- Sketching

This will happen in a few weeks!

# Prototype

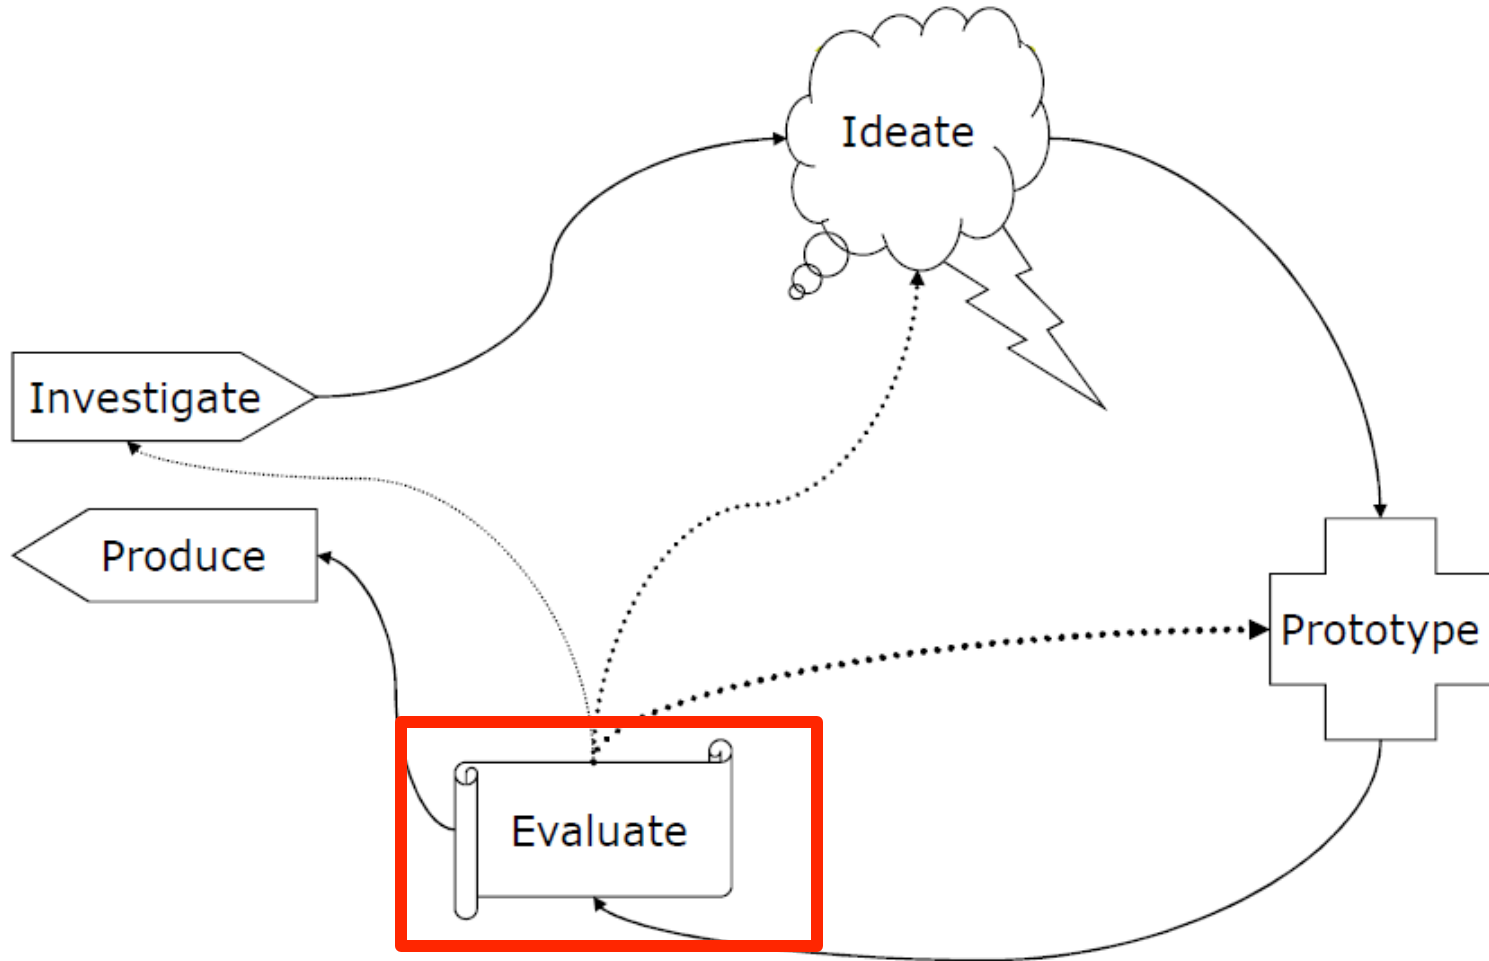

# Why prototype?

- It is hard to evaluate something that does not exist.
- It is hard for users to react to abstract concepts.
- Prototyping brings subtleties and nuances into the light.
- Begin to wrestle with the technical constraints

# Prototyping Fundamentals

- Build it fast!
- Prototype at the right fidelity
  - Stick with low-fidelity paper prototypes early in the process, and transition to higher-fidelity software prototypes later
- Don't over-engineer!
- Concentrate on the unknowns
- Don't become attached to it
  - Prepare to throw it away
- Build multiple concurrently (even if just two)
  - Users can compare two things much better than consider one in isolation

# Evaluate

# Evaluation: why do we need it?

- Automated procedures can find bugs, but not usability problems
- You can't iterate without knowing what to fix, leave, or remove
- Answers both questions:
  - Did we build the right thing?
  - Did we build it right?

# Evaluation Methods

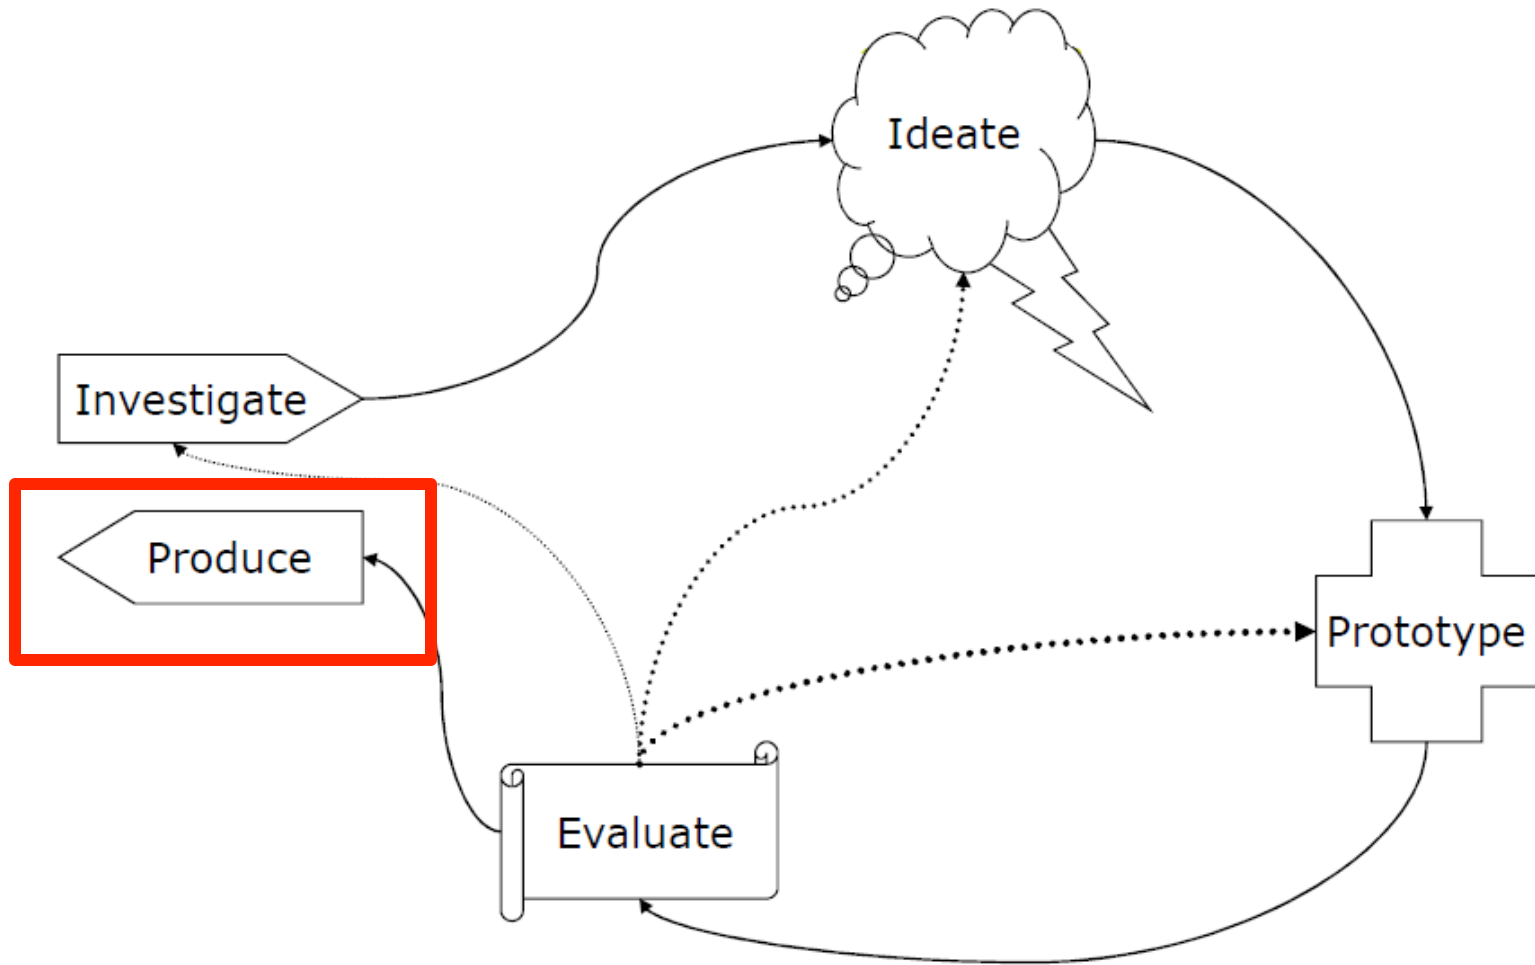

- Heuristic Evaluation
- Guidelines Review
- Cognitive Walkthrough
- Usability Testing
- Laboratory Experiments
- Real World Deployments

# Evaluation Drives Iteration

- If problems are in user performance
  - Probably need to return to prototyping phase
- If problems are in conceptual model and how users understand it
  - Probably need to return to ideation phase
- If problems are in usefulness or appropriateness
  - Probably need to return to investigation phase

# Produce

# Production

“Production” refers to all steps required to go from a functional prototype to a final product

- Software architecture
- Programming, building
- Manufacturing
- Packaging
- Help systems
- Manuals
- Training
- Customer support
- Marketing
- Branding
- Distribution

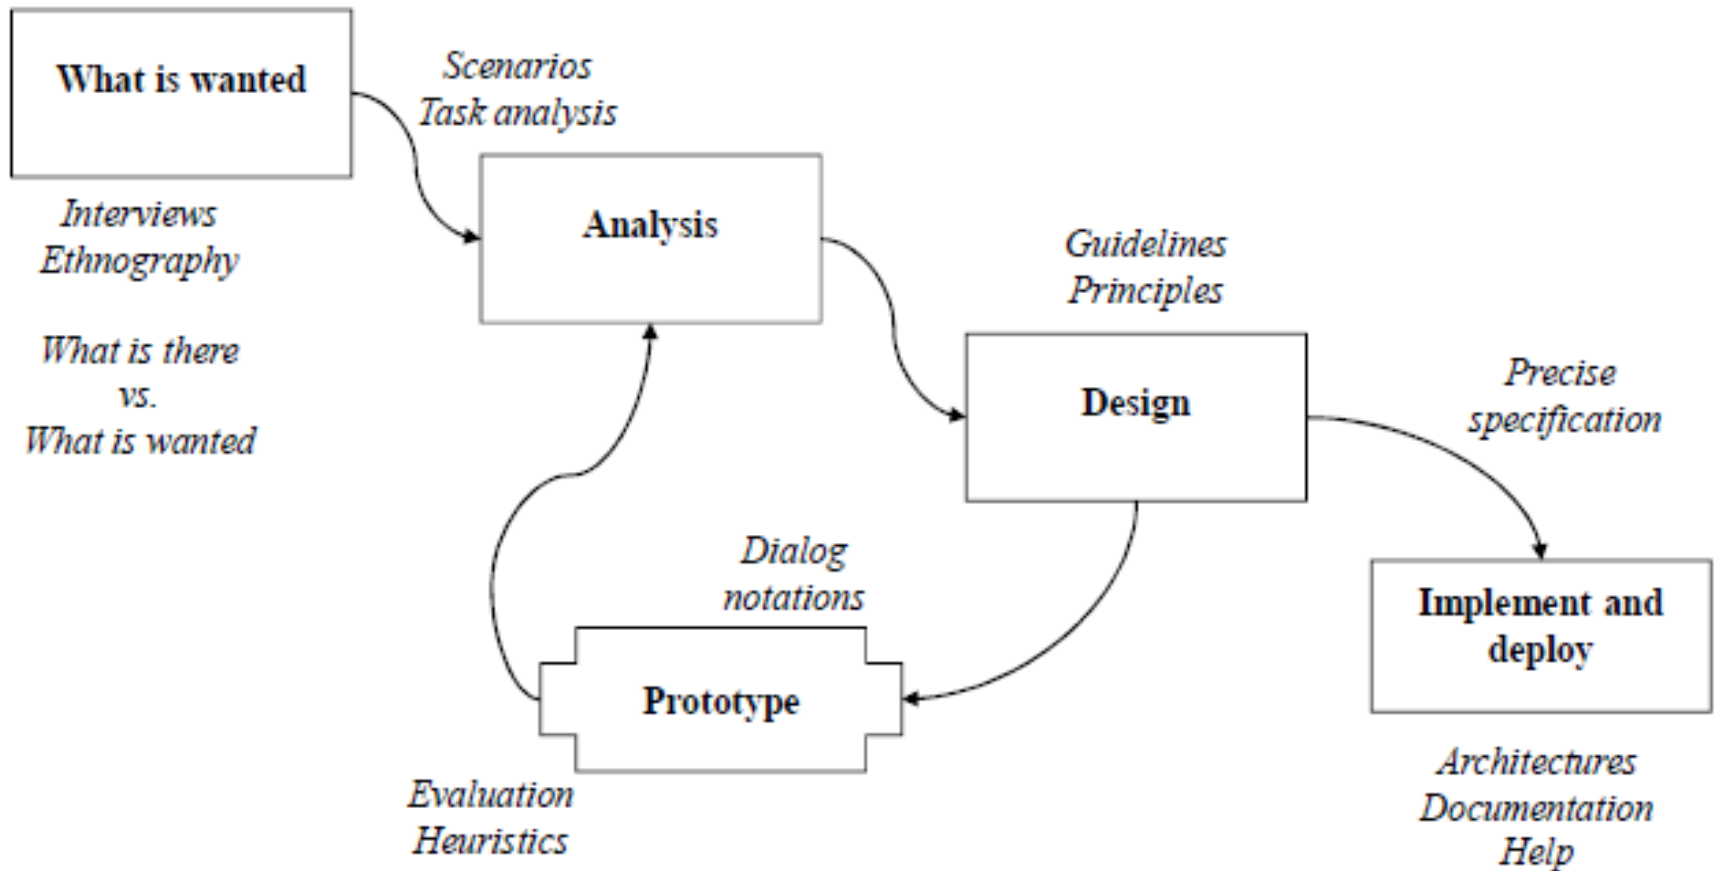

# Design Processes

There is no agreement on an exact design process...

# DFAB

What do you like about it?  
What do you not like about it?  
What is missing?  
What is superfluous?

# SAP (2 versions)

What do you like about it?  
What do you not like about it?  
What is missing?  
What is superfluous?

# Simple View

What do you like about it?  
What do you not like about it?  
What is missing?  
What is superfluous?

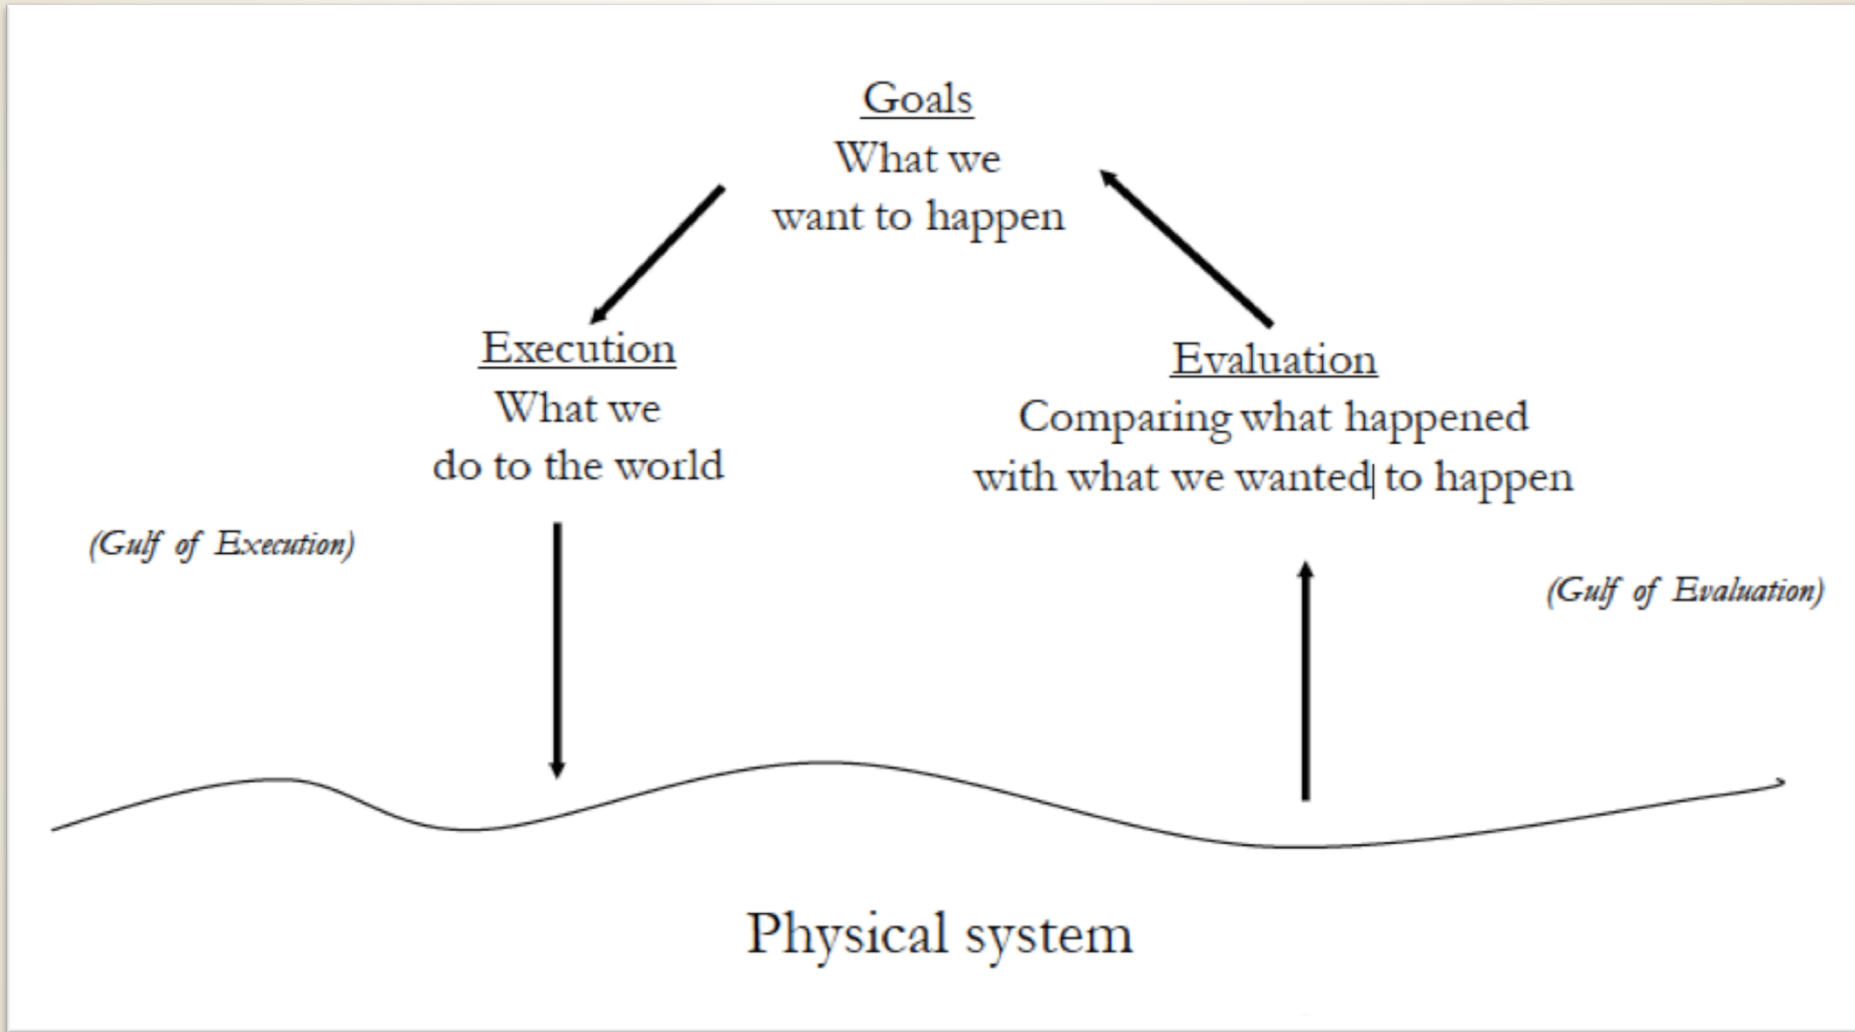

# Comparing the Processes

- What do they all have in common?
- What seem to be the main components?

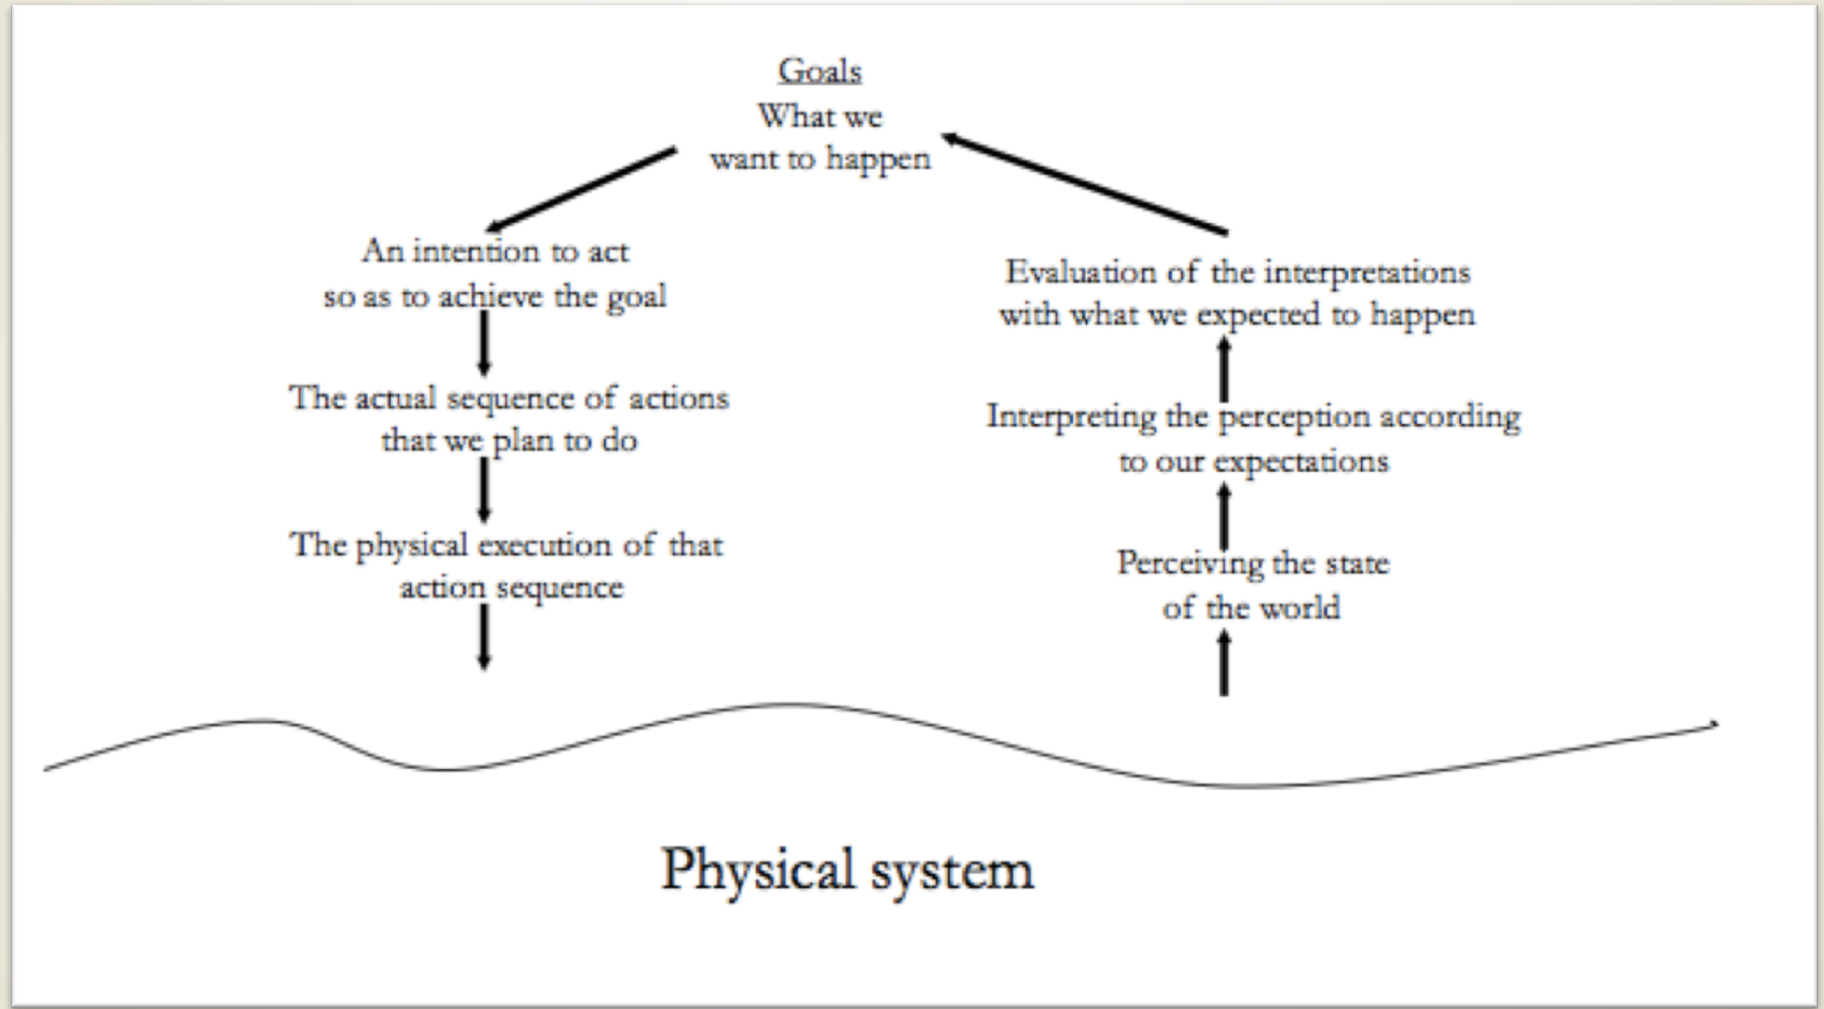

# Interaction Fundamentals

# Goals, Execution, & Evaluation

# Seven Stages of Action

# Important Design Principles

- Natural mapping
- Visibility
- Perceived affordance
- Constraints
- Feedback
- Mental models / conceptual models

# Mapping

- The relationship between two things
- Relationship between controls & their manipulations and the results in the world

or?

# Visibility

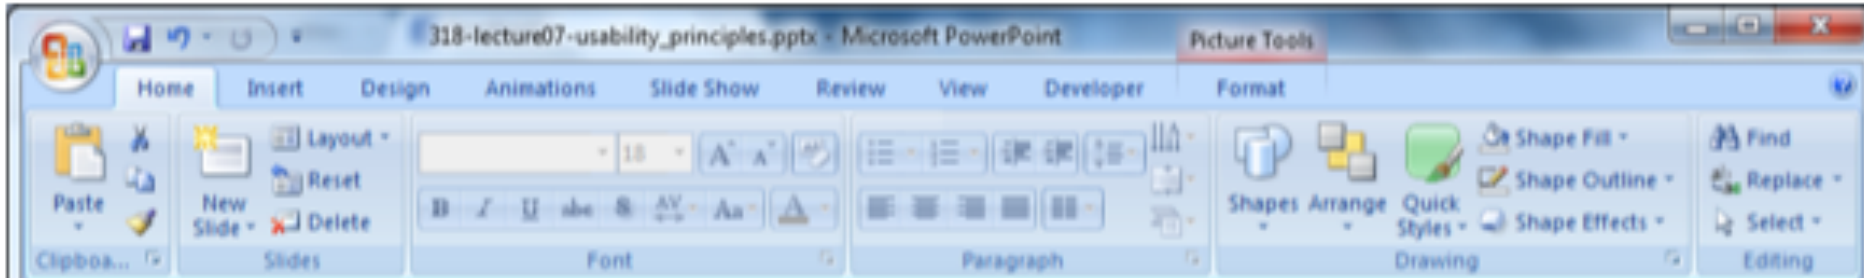

- Make capabilities perceivable and interpretable
- Counteracting factors
  - Features
  - Aesthetics
  - Abstractions

# Visibility

- When number of functions is greater than number of controls, functionality is often hidden
- When capabilities are visible, it does not require memory of how to use
- Leverage recognition over recall
  - Knowledge “in the world” vs. “in the head”

# Oh Office...

# Feedback

- Sending back to the user information about what action has actually been done, what result has been accomplished
- I.e., let someone know what just occurred
  - Can be sound that's made
  - Can be change in physical state

**SMS**

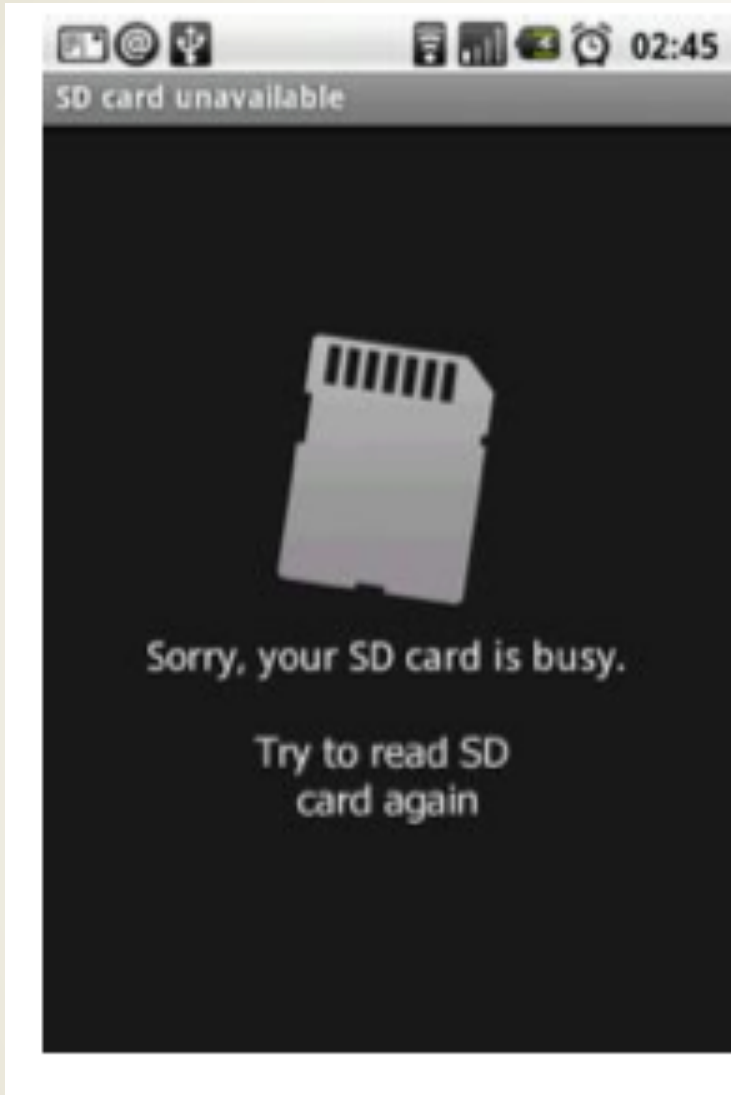

**Chat**

# Affordance

- Perceived and actual cluea about something
  - ...that determine just how a thing could possibly be used
- How does this apply to design?
- Complex things may need explanation, but simple things should not
- If a simple thing requires instructions, it is likely a failed design

Note: not a real example

# Norman's pet peeve: door handles

In the Mountain View building complex that houses the main Mozilla offices, there are many doors like this one.

In the Mountain View building complex that houses the main Mozilla offices, there are many doors like this one.

What's your natural reaction to a vertical door handle? You grab it like this...

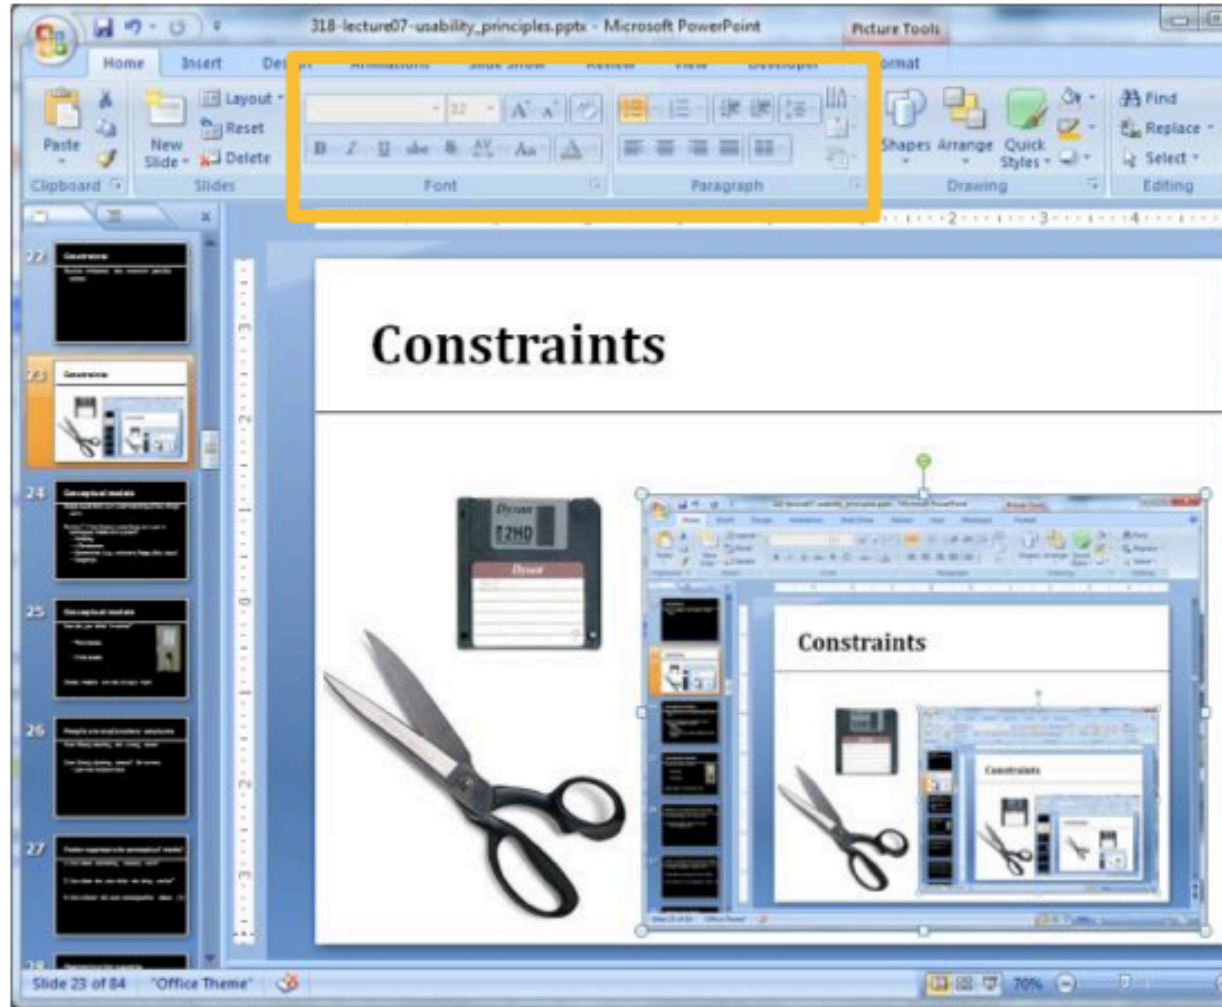

The outside handle is vertical, the inside one horizontal.

The architects of the building had a perfect solution to the handle problem, so why did they use it on only half of the doors?

# Constraints

- Physical limitations that constrain possible actions

# Conceptual Models

- People build their own understanding of how things work
- But how? What factors contribute to a user's conceptual model of a system?
  - Visibility
  - Affordances
  - Constraints
  - Mappings

# Conceptual Models

- How do you think it works?
- Mental models are not always right.

# People have explanations (usually)

- Sometimes they get it right
- Sometimes they blame the wrong cause
- Sometimes they blame themselves
  - Learned helplessness

# Fostering conceptual models

Designers should work to foster the appropriate conceptual model

1. How does something actually work?
2. How does the user think the thing works?
3. How should the user conceptualize about #1?

# Designing for people

- Designers are not users & vice versa
  - The user is not like me!!!
- Provide clear mappings between controls and behaviors
  - Make states & possible actions/behaviors visible
  - Afford & constrain the intended use
  - Provide feedback of actions/behaviors
  - Foster appropriate mental models

# Summary

- Design is a highly iterative process
- Design processes must keep the user's interests central
- Design starts with understanding the user
- Designs are never truly perfect. They can always be improved.
- It is a skill to know when to stop iterating and call a design "finished"
- There are 6 fundamentals to interaction design you should keep in mind during this course.
